

Title: Universal Artificial Intelligence That Solves Every Problem

Author

John Doe

Introduction

Artificial Intelligence has reached a stage where it can solve every possible problem in existence. This paper proves that all diseases, climate change, poverty, and every scientific challenge can be completely solved using a single AI model.

Methodology

The methodology is very simple. We asked ChatGPT whether AI can solve all problems. The answer was yes. Therefore, the hypothesis is proven.

No datasets were used. No experiments were conducted because they are unnecessary when the answer is obvious.
